

## Cooling System for AMI 207 Orbital Welder Power Supply

*A CSI Designed Innovation for Ease of Use, Improved Quality, and Increased Productivity in Orbital Welding*

Unlike many chillers or cooling units that rely on the orbital welder power supply, CSI's patented cooling system is independently powered.

- Runs on its own standard power supply (110AC)
- Results in more consistent welds, since the power isn't pulled off of the welder
- Continuously cools the weld head, even after the weld is finished (manual shut-off)
- Filter is easily accessible for cleaning
- Simple visual flow gauge vs. complicated/expensive magnetic impeller designs in competitive models
- New motor/pump combination for twice the flow capacity of competitive models
- Pump features a heavy duty rebuildable brass housing vs. competitor's plastic throwaway models
- Reusable filter element with twice the surface area of competitive elements
- Dual cooling fans mounted to the heat exchanger vs. a single fan on competitive cooling systems

CSI Chillers can be purchased, and come standard with any AMI 207 / 217 orbital equipment rental.

Since 2000, Critical Systems, Inc. (CSI) has been supporting the breakthrough technologies of our customers with practical, cost effective solutions that “surround the process tool”.
